# Match the player. Add your own source.

A practical reference based on genuine owner-supplied Windows screenshots and feedback from October 22, 2026. No new Windows test or payment was performed to create this handout.

## 1. Identify the exact app

| App in the record | Version recorded |
|---|---|
| IBO Player Pro | Not supplied for this session |
| Smarters IPTV / SmartersPlayer LLC | 1.3.4.0 |
| TvMate IPTV Pro / tivimateiptvpro.com | 1.0.9.0 |

Use the management website displayed inside your installed app. Similar app names can belong to different publishers. The Windows TvMate product here is separate from Android TV TiviMate. A current store build can have different labels.

## 2. Match the input to the details you received

One complete M3U link: use the app's playlist URL field and copy the complete private address. It may contain your account credentials.

Separate XC/Xtream details: put the supplied host URL, username and password into their separate fields. Keep the supplied protocol and port, where present. Your app MAC/device key identifies the player installation; it is not your viewing-account password.

## 3. Save in the matching portal, then reload

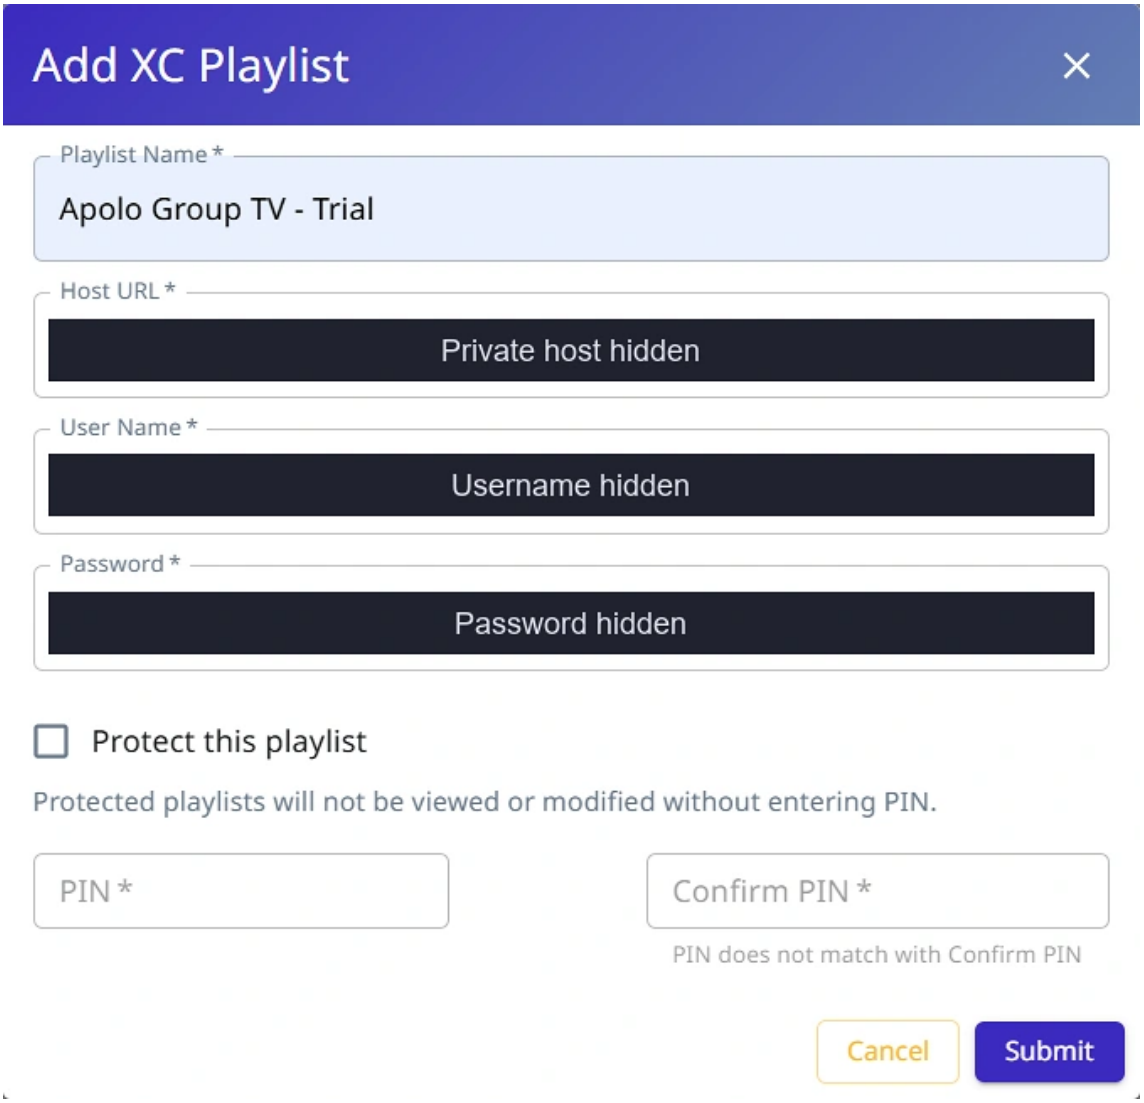

Give the source a recognisable name, save it, return to the Windows app and reload. Select the saved playlist if asked. Let the catalogue finish loading before checking Live TV, Movies and Series.

Keep private: playlist addresses, hosts, usernames, passwords, app device keys, management PINs and account QR codes. Support can start with the app name/version, device and error text.

GENUINE SCREEN / ACCOUNT VALUES COVERED

# The XC fields, shown in a real capture.

The October 22 Smarters IPTV management screen has separate Host URL, User Name and Password fields. Redaction covers the real account values; it does not reconstruct the interface. The unchecked protection option and PIN controls belong to playlist management.

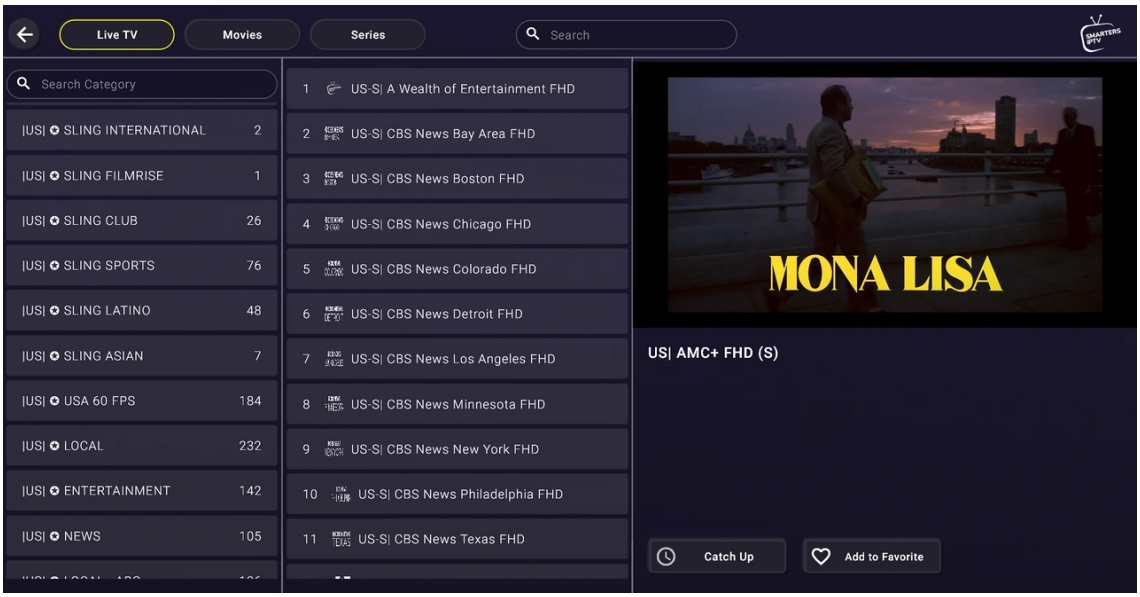

Owner-supplied October 22, 2026 capture. Conventionally cropped and redacted. This is a setup form, not proof of payment or account activation. The current publisher form may differ.

## Need the full workflow?

Open the exact Smarters IPTV Windows walkthrough. Match its publisher before using any similarly named tutorial.

DATED OWNER-REPORTED RESULTS

# Check the viewing that matters to you.

Genuine October 22 Smarters IPTV Windows screen. The visible video frame is captured here. Sound, picture quality and buffering observations were reported by the owner.

## What the owner reported

Live TV, a movie and a series episode played with sound in the three Windows players listed on page 1. Both the supplied M3U and separate XC/Xtream routes worked. No buffering was noticed in those sessions; TvMate also received a no-lag report.

These are dated session observations. Test duration, connection speed, measured resolution and a complete current channel inventory were not recorded. They do not establish results for every stream, device or future connection.

## Your own first-session checks

Try a representative live channel, a movie and an episode. Check picture, sound and controls on your normal connection. Check the programme guide separately: successful video playback does not establish that its schedule loaded. Stay within your simultaneous-stream allowance.

## App licence and viewing subscription are separate

Confirm any player fee in that app's own checkout. Apollo access is chosen separately at apolotvgroup.com/pricing/. Requests, payment confirmation and manual activation are separate steps. No login credentials should be sent in a public comment.

Full walkthrough: apolotvgroup.com/guides/windows/. Check current app requirements and fees with the publisher.
